Balol. Chem. 266:656-6574(1991).

1- CATALYLIC ACTIVITY: An acylcholine + H(2)O = choline + a carboxylic acid anion.

1- SUBUNIT: Homoterramer. The terramer is composed of two dimers. The two subunits in a dimer are linked by a disulfide bond.

1- TISSUE SPECIFICITY: Present in most cells except erythrocytes.

1- MISCELLANBOUS: Cholinesterase is highly reactive with
                                                                                                                                                                                                                                                                                                                                                                  organophosphate esters.

Acyl-ester intermediate (By similarity).
Charge relay system (By similarity).
Charge relay system (By similarity).
Charge relay system (By similarity).
By similarity.
By similarity.
Interchain (By similarity).
N-linked (GlCNAc. .) (Potential).
carboxylic acid anion.
-!- SUBUNIT: Homotetramer. The tetramer is composed of two dimers. The two subunits in a dimer are linked by a disulfide bond (By similarity).
                                                                                                              -!- MISCELLANEOUS: Cholinesterase is highly reactive with organophosphate esters (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 1; Length 602;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CRC64;

C;Cybuction: Hydrolyzes acetylcholine to choline and acetate
A;Bescription: hydrolyzes acetylcholine to choline and acetate
C;Function:
A;Bescription: hydrolyzes acetylcholine to choline and acetate
C;Superfamily: cholinesterase; cholinesterase homology
C;Keywords: alternative splicing; carboxylic ester hydrolase; glycoprotein; neurotransmil

A; Experimental source: strain Coker312; fiber
C; Function:
A; Description: catalyzes reversible cleavage of sucrose into UDP-glucose and D-fructose
C; Superfamily: sucrose synthase; sucrose-phosphate synthase homology
C; Keywords: glycosyltransferase; hexosyltransferase
                      hypothetical protein At2g44230 [imported] - Arabidopsis thaliana
N;Alternate names: hypothetical protein F411.4
N;Alternate names: hypothetical protein F411.4
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 05-Mar-1999 #sequence_revision 05-Mar-1999 #text_change 09-Jul-2004
C;Accession: T02379; A84876
R;Rounsley, S.D.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, S.M.; Kaul
Bubmitted to the EMBL Data Library, May 1998
A;Bescription: Arabidopsis thaliana chromosome II BAC F411 genomic sequence.
                                                                                                                                                                                                                                                                                                                                                                                             A.Residues: 1542 <ROUS

The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChB, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function (cognitive function) and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                         This 14-mer peptide corresponds to residues 535-548 of the Acetylcholinesterase mature protein. This peptide is known to act alone or in synergism with a fragment of beca-amyloid to contribute to neuronal degeneration. Compounds that inhibit the biological activity of the novel peptides, and antibodies, can be used to control cytoplasmic calcium ion currents in vivo, and are useful for treating disorders of the central nervous system (e.g. Parkinson's and Alzheimer's diseases), stroke and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Acetylcholinesterase; AChE; neurodegenerative disease; brain; neurological disorder; Alzheimer's disease; Parkinson's disease; motor neuron disease; prion-related disease; NMDA; N-methyl-D-aspartate;
for treating disorders of the central nervous system, cancer and stroke.

The peptide is useful for screening a compound for the ability to inhibit amyloid-type fibril formation, for preparing a compound by identifying an inhibitor of fibril formation, for determining whether a peptide or polypeptide or a variant is an amyloidogenic analogue of the Synaptica peptide. The peptide is also useful for determining whether variants will decrease surface tension in aqueous solution. The compounds detected are used for treating Alzheimer's disease, Parkinson's disease and motor neuron disease. Sequences AsG65979-ABG66630 represent human Synaptica peptide variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, acetylcholinesterase, Synaptica peptide, enzyme, AChB, amyloid; acetylcholinesterase, fibril formation; surface tension; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease;
cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus to testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervous system damage, which is an order of magnitude greater than that of the neurotoxin NWDA (N-methyl-D-aspartate). The lesions produced can be identified using simple behavioral tests known to be affected by hippocampal dysfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel use of the 14 mer synaptica peptide, or its amyloidogenic variant capable of fibril formation, in screening a compound for ability to inhibit amyloid-type fibril formation by the peptide.
                                                                                                                                                                                                                                                                       Gape

The invention relates to antibodies which recognise acetylcholinesterase (AChE) or a C-terminal peptide thereof (particularly AAB48914-B48916).
The ACHE splice variant, AChE-R, and AChE-R mRNA, have been found to be elevated in response to central nervous system (CNS) insults. The elevated in response to central nervous system (CNS) insults. The invention therefore also relates to a method for diagnosing CNS stress, and also elevated glucocorticoid levels, disruption of the blood-brain barrier or Alzhaimer's disease using a sample (e.g., serum or cerebrospinal fluid) and an antibody of the invention. The CNS stress systhological insult, physical insult (head injury, head trauma, or exposure to irradiation) or chemical insult (exposure to insecticide or nerve gas). The present sequence represents a human AChE C-terminal peptide which is specifically claimed as an epitope which is recognised by an antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ASP-1; haemostatic; acetylcholinesterase; AChE; cell growth; human; cell differentiation; thrombocytopenia; post-irradiation condition; post-chemotherapy condition; blood loss; stress-induced male infertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                The present sequence is a C-terminal peptide of acetylcholinesterase (AChE). This peptide is acetylcholinesterase "synaptic" peptide (ASP-1). This peptide has a cell growth and/or cell differentiation activity. The peptide may be used in ex vivo or in vivo expansion of haematopoietic stem cells and neural progenitors, and in the promotion of magakaryocytic differentiation of hematopoietic stem cells. In addition, the present peptide may be used in for promoting expansion of committed neural progenitors in a developing embryo, in cultured embryonic stem cells, and embryoid bodies derived from them. The present peptide may further be used in the treatment of thrombocytopenia, poet-irradiation conditions, post-chemotherapy conditions, and conditions following massive blood loss, in inducing synthesis of AChE mRNA, and in promoting formation of hematon bodies. Antibodies directed against the present peptide are

The invention relates to a nucleic acid sequence coding for a singlechain variable fragment (scFv) antibody that has specific affinity for the synaptic variant of acetylcholinesterase (ACDE-S), where the scFv antibody consists essentially of a polypeptide comprising the binding cortion of the heavy chain variable region of an antibody. Also included are an expression vehicle comprising a nucleic acid sequence coding for a scFv antibody that has specific affinity for the synaptic variant of ACHE. S. an acfv antibody specifically recognising and binding to the synaptic variant of ACHE. S and a method for the diagnosis of a progressive current of ACHE variants of the sample. The single-chain Fv antibody is useful for the wariants in the sample. The single-chain Fv antibody is useful for diagnosing a progressive neuromuscular disorder which involves any one of muscle distortion, muscle re-innervation and neuromuscular junction (NMJ) abnormalities. The disorder is Mysathenia gravis (preferred), Eaton-Lambert disease, muscular dystrophy, amyotrophic lateral sclerosis (ALS), conformalities stress disorder (FTSD), multiple sclerosis, post-injury muscle damage, excessive re-innervation, errors disorder (FTSD), multiple sclerosis, post-innervation, cor post-exposure to ACHE inhibitors. The present sequence represents the conformal conformal acetylcholinesterase encoded by a synaptically
                                                                                                                                                                                                                                                                                                           Nucleic acid sequence coding for a single-chain variable fragment (scFv) antibody that has specific affinity for the synaptic variant of acetylcholinesterase (AChB-S), useful for diagnosing a neuromuscular disorder, e.g. Myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Acetylcholinesterase; AChE; neurodegenerative disease; brain;

                                                                                                                                                                                       This
                                                                                          which
                                                                                                                                                        The sequence represents the amino acid sequence of a biologically active fragment of rat acetylcholinesterase (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function (cognitive function) and/or cause improvement or deterioration of collular damage in the brain. The animal models are also useful as a

The sequence represents the amino acid sequence of a biologically active fragment of mouse acetylcholinesterase (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular cegeneration and leads to impalament of testable brain function that is indicative of a neurological disorder in a human. The animal model is indicative of a neurological disorder in a human. The animal model is cuseful for testing an agent for biological activity in a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function collular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for model for Parkinson's disease. The AChE peptide causes considerable creatment of Parkinson's disease. The AChE peptide causes considerable creatment of parkinson's disease. The AChE peptide causes considerable creatment of parkinson's disease. The AChE peptide causes considerable continential dusing simple behavioral tests known to be affected by

```
The sequence represents the amino acid sequence of a biologically active fragment of human acetylcholinesterase (AchB). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AchB, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impalrment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a neurodegenerative disorder which involves administering the agent to a contitive function) and/or cause imparement of the testable brain function (cognitive function) and/or cause improvement or deterioration of cognitive function) and/or cause improvement or deterioration of diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChB peptide causes considerable corvous system damage, which is an order of magnitude greater than that of the neurocoxin NMDA (N-methyl-D-asparatet). The lesions produced can be identified using simple behavioral tests known to be affected by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                  The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase (ACHE) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identified by means of inhibition by a blocker of (I). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of ACHE, where the neurological disorder is Alzheimer's disease, parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of mouse ACHE polypeptide containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
             Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alpha 7 nicotinic receptor; acetylcholinesterase; AChE; synaptica; antiparkinsonian; nootropic; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease.

                                                   The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or anisapoist of an acetylcholinesterase (AChE) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChE, where the neurological disorder is Alzahemer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-motor neuron disease. It is useful for inhibiting or preventing non-motor neuron disease. It is useful for inhibiting or preventing non-motor neuron disease. It is useful for inhibiting or preventing non-represents the partial sequence of human AChE polypeptide containing the synaptica peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alpha 7 nicotinic receptor; acetylcholinesterase; AChE; synaptica; antiparkinsonian; nootropic; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease.

(AChE) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identified by means of inhibition by a blocker of (I). Methods for are also provided. The identified functional analog or antagonist a useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChE, where the neurological disorder is alzaeimer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of rat AChE polypeptide containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a human acetyl-cholinesterase (AChE) variant used in the method of the invention, where inhibitors of AChE are unsed to treat injury to the central nervous system (CNS). The AChE inhibitor can also be used to facilitate transplantation of neuronal cells to the CNS of a patient. The inhibitor can also be used to improve hippocampal neuron survival following injury to the CNS. The CNS injuries that can be treated with the method include epilepsy, stroke, Huntington's disease, head injury, spinal injury, pain, Parkinson's disease, myelin deficiencies, neuromuscular disorders, neurological pain, amyotrophic lateral sclerosis, Alzheimer's disease, and affective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gарв

cetylcholine esterase splice variant E1-4,6. The ACHE E1-4,6 variant comprises of residues encoded by exons 1-4 of ACHE Linked to residues comprises of residues encoded by exons 1-4 of ACHE Linked to residues for the human acetylcholine esterase 14 (ACHE-14) readthrough splice variant (AM48797). The invention provides a pharmaceutical composition, for facilitating passage of compounds through the blood/brain barrier (BBB), comprising of ACHE-14, 14 peptide (see AAM48797) or ACHE-14 analogues (such as the ACHE E1-4, 6 variant) together with a pharmaceutically acceptable carrier. The pharmaceutical composition is claimed to facilitate a reversible disruption of the BBB allowing transport of compounds through the BBB. The compounds, e.g. imaging capents, antibiotics or chemotherapeutic drugs, are claimed to be useful for the diagnosis and treatment of diseases or disorders of the CNS such as infections, neurochemical disorders, brain tumours, gliomas, etc

Sequence 45 AA;

```
This represents the amino acid sequence of a negative certification in AAV41278 (AChE) splice variant. The invention provides sequences shown in AAV41278 to AAV41285 that represent synthetic nuclease resistant antisense coisodecoxynucleotides which are capable of selectively modulating human acetylcholinesterase (AChE) production. These oligonucleotides are capable of selectively modulating human AChE production in the central nervous system and neuromuscular junction. The invention also provides a method for determining the efficacy of these human AChE specific antisense oligonucleotides. These antisense oligonucleotides can be used to restore balanced choliners as symmaling in the brain, particularly related to learning and memory as well as stress disorders packinson's with e.g. myasthenia gravis. The oligonucleotides work effectively at low doses withe avoiding many of the side effects associated with rearine and related cholinersic drugs for Alzheimer's disease and pyridostigmine and crelated drugs for myasthenia gravis

The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C-terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a neurodegenerative disorder which involves administering the agent to a neurodegenerative disorder which involves administering the agent will inhibit, prevent or decrease impairment of the testable brain function collular damage in the brain. The animal models brain function and/or cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for parkinson's disease. The AChE peptide causes considerable creatment of Parkinson's disease. The AChE peptide causes considerable continent of Barkinson's disease. The AChE peptide causes considerable continentified using simple behavioral tests known to be affected by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.

acting as a functional analog or antagonist of an acetylcholinesterase acting as a functional analog or antagonist of an acetylcholinesterase (ACHE) polypeptide fragment (Synaptica peptide) on (1). If (1) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (1). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of ACHE, where the neurological disorder is Alzheimer's disease, Parkinson's disease or motor neurological sequence is a seful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of bovine ACHE polypeptide containing the synaptica peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the use of an alpha 7 nicotinic receptor (1) or its functional analog to determine whether a compound is capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                  Alpha 7 nicotinic receptor; acetylcholinesterase; AChE; synaptica; antiparkinsonian; nootropic; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C-terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a model for Alzheimer's disease and determining whether the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function control and/or cause improvement or determination of cellular demages in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervous system damage, which is an order of magnitude greater than that continue the province of magnitude greater than that the province of the neurotoxin NDDA (N-methyl-D-asparrate). The lesions produced can be accompanied to the province of the methyl-D-asparrate).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                                                                                                                        neeryicholinesterase; AChE; neurodegenerative disease; brain; neurological disorder; Alzheimer's disease; Parkinson's disease; motor neuron disease; prion-related disease; NMDA; N-methyl-D-aspartate; hippocampal dysfunction; rabbit.

The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinestersse (AChB) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChB, where
                                                                                                                                                                                                                                                                                       the neurological disorder is Alzheimer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of rabbit AChB polypeptide containing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to C-terminal peptides of acetylcholinesterase (AChE) (see AAB50032-B50034). The peptides of the present invention have call growth and/or call differentiation activity. The peptides may be used in ex vivo or in vivo expansion of naematopoietic atem cells and neural progenitors, and in the promotion of megakaryocytic differentiation of hematopoietic stem cells. In addition, the peptides may be used in for promoting expansion of committed neural progenitors in a developing embryo, in cultured embryonic stem cells, and embryoid bodies derived from them. The peptides may further be used in the treatment of thrombocytopenia, post-irradiation conditions, post-chemotherapy conditions, and conditions following massive blood loss, in inducing synthesis of AChE mRNA, and in promoting formation of hematon bodies. Antibodies directed against the peptides are useful for cliagnosing stress-induced male infertility. The present sequence is a C-terminal AChE "synaptic" protein (ASP), which was used in a yeast two-pybrid system, to screen for ARP binding partners
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention relates to a method and system for evaluating an. effect on the nervous system of a test drug. The method comparises comparing the effect of the drug on acetylcholinesterase (AChB) catalytic activity or isoform variance in a brain of a test animal following a challenge by an AChB blocker or a blocker of AChB and muscarinic receptors MI and M2 (e.g. pyridostigmine) and comparing this effect with that of a known agent, preferably a non-selective muscarinic receptor. Co blocker (e.g. scopolamine) or a specific MI receptor blocker (e.g. piranzepine). The method is useful for evaluating an effect on the correspondance of a test drug, including drugs for the treatment of nervous system of a test drug, including drugs for the treatment of antifunctioning, neurodegenerative disorders, damage resulting from exposure to xenobiotics, panic, neuromuscular disorders, Parkinson's disease. Huntington's chorea, muscle farigue, multiple chemical consentivity, autism, multiple sclerosis and sjogren's disease. The sequence represents a protein described in relation to green fluorescent protein (GPP)-fused AChB variant expression construct pGASP
                                                                                                                                                                     Evaluating effect of drugs on nervous system by comparing effect of drug on acetylcholinesterase, AChE activity in brain of test animal following challenge by AChE blocker and comparing it with control group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neuroprotective; Cerebroprotective; Anti-HIV; Antiallergic; Antiantlammatory; Thyromimetic; Gene therapy; human; enzyme; cell proliferative disorder; cancer; atherosclerosis; neurological disorder; epilepsy; Huntington's disease; stroke; immune disorder; inflammatory disorder; AIDS; allergies; developmental disorder; Hypothyroidism; Cushing's syndrome; infection; ENZM-28.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                Tang YT;
                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human enzymes (ENZM-1 - ENZM-46, ADL90191-ADL90282). The sequences are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of the enzymes, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's diseases, stroke), immune/inflammatory (e.g. ADL90283), allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections.
                                                                                                                                                                                                                                                                                                        New human enzymes (ENZM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant ENZM expression e.g. cancer, AIDS, epilepsy, or infections.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human cliagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic adsorders, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confections and sloo be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gietzen D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Organophosphorous poisoning; OP; cancer; leukaemia; megakaryocytopoiesis;

Favero KD;
disclosed is the gene sequence encoding the protein. The cDNA is 1936 bp in length and the protein is composed of 526 amino acid residues. The process for preparing the protein and nucleic acid sequence, the process for detecting the AR-ACHE nucleic acid sequence and polypeptide in a sample, and the process for promoting or inhibiting cell withering are also disclosed. The current sequence represents the human acetylcholinesterase isomer protein amino acid sequence

Human acetylcholinesterase (EC-3.1.1.7) is accumulated at neuromuscular junctions where it serves a vital function in modulating cholinergic neurotransmission. Alternatively spliced forms of human AChE may be expressed in transgenic animals which are used in an assay system for determining the anti-ChE activity of organophosphates, carbamates, anti-ChE drugs, plant glycoalkaloids and snake venoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a method of enhancing organophosphate detoxifying
                                                                                                                                                                                                           Alternative forms of human acetyl cholinesterase (ChE) gene - expressed in transgenic animal assay system for evaluating anti-ChE activity of organo:phosphate(s), etc. or as model of ChE imbalance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enhancing the organophosphate detoxifying capabilities of esterases for the treatment of organophosphate poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Organophosphate; detoxification; esterase; acetylcholinesterase; AChE; butrylcholinesterase; BuChE; carboxylesterase; CaE; sheep dip; human; nerve agent; organophosphorus acid anhydride; OFAA; mutant.

capabilities of esterases (either human acetylcholinesterases (AChE), human butrylcholinesterases (BuChE) and/or carboxylesterases (GEE)), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CAE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases and seed to decontaminate ground and buildings and equipment used to store, or contaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring coganophosphorus acid anhydride (OPRA) hydrolyzing enzymes. They are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a method of enhancing organophosphate detoxifying capabilities of esteraese (either human acetylcholinesteraese (AChE), human butrylcholinesteraeses (BuChE) and/or carboxylesterases (CaE), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CBE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates turough contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or contaminated by organophosphates. The method setorases with improved detoxification properties over naturally occurring
decontaminate ground and buildings and equipment used to store, or contaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPPA) hydrolyzing enzymes. They are also less likely to be inactivated by the OPPA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           They are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (AChE), human butrylcholinesterases (BuchE) and/or carboxylesterases (CaE)), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuchE and/or human CaE). The modified esterases may through contact with chemical workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel conteminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (OPAA) hydrolyzing enzymes. They are also

The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (AChE), muman butrylcholinesterases (BuChE) and/or carboxylesterases (CaE), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CaE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or decontaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also test likely to be inactivated by the OPAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

                                                                                                                                                                                                                                                                                                                               The invertion by overtical a method of entertain capabilities of esterases (BuChE) and/or carboxylesterases (ACHE), human butrylcholinesterases (BuChE) and/or carboxylesterases (GEB), that comprises substituting a histidian residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human ACHE, human BuChE and/or human CAE). The modified esterases (either them be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat agricultural sa sheep dips. They may also be used to treat agricultural such as sheep dips. They may also be used to the esterases may also be used to contaminate ground and buildings and equipment used to store, or decontaminate ground and buildings and equipment used to store, or improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPAM) hydrolyzing enzymes. They are also resulted by the OPAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                       The invention provides a method of enhancing organophosphate detoxifying
                                                                                                                                                                                                                                                           Enhancing the organophosphate detoxifying capabilities of esterases for the treatment of organophosphate poisoning.

The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (ACBE), human butrylcholinesterases (BuChE) and/or carboxyleaterases (GAE), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CaE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or decontaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
The invention relates to a polymucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for predicting a haplotype pair of ACHE gene of an individual, a method for predicting a haplotype pair of ACHE gene of an individual, a method for the profession of ACHE gene of the read or the organism expresses ACHE protein encoded by the first nucleotide where the organism expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence, an isolated antibody specific for and immunoreactive with ACHE, a method of screening for drugs targeting the polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by haplotypes 1-20 given in the specification. The Polymorphisms are useful for studying the biological function of ACHE as well as in identifying drugs targeting this protein for the treatment of disorder related to its abnormal expression or function. The polymorphism as position cued in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                     New polymorphic variants comprising acetylcholinesterase (ACHE) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           r, leukaemia, and tumours. The ACHE gene maps to human chromosome
The present sequence is the ACHE protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The invention relates to a polymucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype complement, the variant comprising an ACHE isogene defined by a haplotype complement, the specification. Also included are methods for haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and sanociation between a trait and at least one haplotype or haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene of an incleotic content of across the polymorphic variant sequence or encoded by the polymorphic variant where the organism expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence or encoded by the polymorphic variant with a candidate agent and assaying for binding activity, a computer system for storing and analysing polymorphism data for ACHE gene and a genome anthology for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by haplotypes 1-20 given in the specification. The Polymorphisms are useful abnormal expression or function. The polymorphic variant may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.g. neurological diseases (e.g. perkinson's disease and Alzhaimer's disease) cancer, leukaemia, and tumours. The ACHE gene maps to human chromosome 7q22. The present sequence is an ACHE protein polymorphic variant. Note: The present sequence is not shown in the specification but was created by the indexer from the ACHE sequence shown in figure 3 (AAU11231)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ACHB; acetylcholinesterase; polymorphic variant; haplotyping; genotyping; neurological disease; Parkinson's disease; Alzheimer's disease; cancer; leukaemia; tumour; chromosome 7g22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 87; DB 5; Length 614; 100.0%; Pred. The invention relates to a polymucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isoagene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait an individual, a method for identifying an association between a trait conhuman organisms transformed or transfected with the polymorleotide where the organism expresses ACHE protein encoded by the first nucleotide where the organism expresses ACHE protein encoded by the first nucleotide where the organism expresses ACHE polymorphic variant sequence, an isolated activity a cartibody specific for and immunoreactive with ACHE, a method of screening for drugs targeting the polymorphism ACHE polymorphic variant computer with a candidate agent and assaying for binding activity, a computer system for storing and analysising polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by haplotypes 1-20 given in the specification. The Polymorphisms are useful for storing and analysis high function of ACHE as well as in identifying drugs targeting this protein for the treatment of disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.

The present sequence is an ACHE gene maps to human chromosome 7q22. The present sequence is an ACHE protein polymorphic variant. Note:

The present sequence is an ACHE gene maps to human chromosome 7d22. The present sequence is an ACHE protein polymorphic variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                         New polymorphic variants comprising acetylcholinesterase (ACHE) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological

```
The invention relates to a polynucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotypes and the specification. Also included individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene, recombinant conhuman organisms transformed or transfected with the polymorleotide where the organism expresses ACHE protein encoded by the first nucleotide where the organism expresses ACHE protein encoded by the polymorphic variant sequence, an isolated activity activity a computer sequence or encoded by the polymorphic variant sequence, an isolated control and immunoreactive with ACHE, an enchod of screening for drugs targeting the polymorphism for binding activity, a computer or system for storing and analysing polymorphism data for ACHE gene and a genome anthology for ACHE gene and analysing olymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by taplotypes 1-20 given in the specification. The Polymorphism are useful corruspated in screening for compounds targeting ACHE isogenes defined by taplotypes 1-20 given in the specification. The polymorphic variants may also be condition or diseases (e.g. Parkinson's disease and Alzhaimer's disease), cancer, leukaemia, and tumours. The ACHE gene maps to human chromosome 7q22. The present sequence is an ACHE protein polymorphic variant. Note:

The present from the ACHE sequence shown in figure 3 (AAU11231)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa

RESULT 43

Human acetylcholinesterase, ACHE variant #2.

(first entry)

26-FEB-2002

AAU11233;

```
The present invention relates to novel human drug metabolising enzymes,

DME-11 to DME-13 (ABP59210-ABP59222) and their coding sequences (ABZ81301-
ABZ81113). The sequences are useful for diagnosing, treating or

DEVENTIAL THE sequences are useful for diagnosing, treating or

particularly cell proliferative disorders (e.g. arteriosclerosis,

atherosclerosis, cirrhosis, paroxysmal nocturnal haemoglobinuria,

checklopmental disorders (e.g. renal tubular acidosis, anaemia or mental

retardation), endocrine (e.g. osteoporosis, thrombocytopenia or mental

cetardation), endocrine (e.g. osteoporosis, thrombocals, diabetes), eye

disorders (e.g. glaucoma, kerattis), metabolic (e.g. hyperlipidaemia,

cystic fibrosis), gastrointestinal disorders (e.g. hyperlipidaemia,

cystic fibrosis), gastrointestinal disorders (e.g. syndrome), or

diarrhoea), liver disorders (e.g. AIDS, allergies, asthma,

autoimmune thyroiditis, contact dermatitis, Crohn's disease,

clomerulomophritis, Goodpasture's syndrome, gout, Graves' disease,

dashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis,

stepanial syndrome, uveitis, liver are also useful in the assessing the

stepanial syndrome, uveitis, are also useful in the assessing the

```

ts of exogenous compounds on the expression of nucleic acid and acid sequences of DME. The polynucleotides encoding DME are useful reating transgenic animals to model human disease

Sequence 614 AA or creating

amino

```
The present sequence represents human acetylcholinesterase (YT blood group). Single cell biosensors of the invention which overexpress the muscarinic receptor are used to detect acetylcholinesterase inhibition.

The muscarinic receptor is a G protein-coupled receptor (GPCR) that translocates arrestins. The specification describes a single cell biosensor comprising a cell which overexpresses arrestin and at least one GPCR, the arrestin or the cell is detectably labeled for monitoring internalisation of the GPCR. The biosensor detects various bioreactive ligand species in the sample, as opposed to other antibody based methods, such as radioimmunoassay, which detects only the ligand species with the reactive epitope. The biosensor is useful for detecting a GPCR ligand in a test sample, for monitoring a GPCR ligand in a mammal, for detecting a compound which modulates a GPCR ligand in a test sample, cor monitoring a gere sample, cor detecting a compound that modulates GPCR ligand in a test sample, cor sample. It is useful for altering GPCR internalisation. It is also useful cor for detecting an inhibitor of acetylcholinesterase in a test sample

```
The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
